Node.JS

Ex - Files

1. Create a JSON file represents a Person with the following structure:

```
name: "",
address:
{
    city: "",
    street:
    {
            name: "",
            number: ""
    }
}
```

Fill the file with 2 Person data.

Write a function in a module called filesUtils that receives a street name and returns (after 2 seconds) the person's name who lives there.

2. Create a utils module with a function that receive a user id and returns an object with data pulled from the following json files

```json
{                                          {
  "phones" : [                               "users" : [
      {                                          {
          "userid" : 1,                              "id" : 1,
          "phones" : ["054-444", "02-22222"]         "name" : "Avi Cohen"
      },                                         },
      {                                          {
        "userid" : 2,                              "id" : 2,
        "phones" : ["052-444"]                     "name" : "Dana Levy"
      },                                         },
      {                                          {
        "userid" : 3,                              "id" : 3,
        "phones" : ["050-9999", "03-33333"]        "name" : "Roee Gefen"
      }                                          }
  ]                                          ]
}                                          }
```

Call the function from the main file and print the given result.
